A0303S-1WR2 is designed for use in distributed power supply systems and especially suitable in applications such as pure digital circuits, low frequency analog circuits, relay-driven circuits and data switching circuits, where:

1. The voltage of the input power supply is relatively stable with a variation of ±10%Vin or less;

2. An input to output isolation voltage of up to 1500VDC is necessary;

3. The requirement for a tight line and load regulation is not as strict.

Such as pure digital circuits, low frequency analog circuits, relay-driven circuits and data switching circuits.

Design Reference

1. Typical application

Input and/or output ripple can be further reduced, by connecting a filter capacitor from the input and/or output terminals to ground as shown in Fig.3.

Choosing suitable filter capacitor values is very important for a smooth operation of the modules, particularly to avoid start-up problems caused by capacitor values that are too high. For recommended input and output capacitor values refer to Table 1.

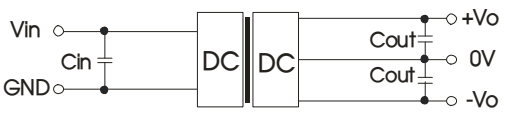

Fig.3

Recommended capacitive load value table (Table 1)

Vin (VDC)	Cin (μF)	Dual Vout (VDC)	Cout (μF)
3.3	4.7	±3.3	4.7

It is not recommended to connect any external capacitor when output power is less than 0.5W.

2. EMC (CLASS B) compliance circuit

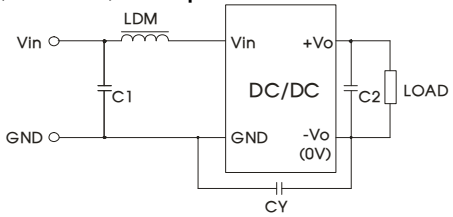

Fig. 4

Input voltage (VDC)		3.3
EMI	C1	4.7μF /50V
	C2	Refer to the Cout in Fig.3
	CY	--
	LDM	6.8μH

Note: It is not needed to add the component in the peripheral circuit when parameter with the symbol of "--".

3. Minimum Output Load Requirement

For a reliable and efficient operation of the converter, the minimum load should never be less than 10% of the rated output load. If the total required output power is below 10%, a parallel bleeding resistor is required on the output, ensuring that the sum of the power consumption is always maintained at 10% minimum.
